

CARE AND MAINTENANCE

To extend the life of your Delta reel, always protect the outer frame and spool. We also recommend the following easy maintenance tips:

- ✦ To clean the reel, first rinse off any dirt or grit in cool fresh water.
 - ✦ Use a cloth or toothbrush to carefully remove all sand and grit from the reel with warm soapy water and rinse again.
 - ✦ Separate the spool from the frame and dry thoroughly.
 - ✦ Once dry, reduce the drag pressure to the lowest setting and store in the reel case.
 - ✦ Always store reel away from extreme heat.
 - ✦ After using in saltwater, always take the time to clean your reel. Saltwater can leave a residue that will harden over time if not properly cleaned and dried.
-

RETRIEVAL CONVERSION

- 1 Remove the spool from the frame by squeezing the hub release lever and lifting the spool free.
 - 2 Unscrew the clutch bearing cap on the spool hub located opposite of the handle side.
 - 3 Turn the spool over and tap out the one-way bearing.
 - 4 Replace the one way bearing in the frame with the metal housing facing up for right hand retrieve.
 - 5 Screw the cap back into position covering and securing the clutch bearing in place. Ensure that the cap is tight and properly seated.
 - 6 Place the spool back in the frame.
 - 7 Assure correct retrieve direction and smooth operation.
