

## CARE AND MAINTENANCE

---

To extend the life of your Rise reel, always protect the outer frame and spool. We also recommend the following easy maintenance tips:

- ✦ To clean the reel, first rinse off any dirt or grit in cool fresh water.
  - ✦ Use a cloth or toothbrush to carefully remove all sand and grit from the reel with warm soapy water and rinse again.
  - ✦ Separate the spool from the frame and dry thoroughly.
  - ✦ Once dry, reduce the drag pressure to the lowest setting and store in the reel case.
  - ✦ Always store reel away from extreme heat.
  - ✦ After using in saltwater, always take the time to clean your reel. Saltwater can leave a residue that will harden over time if not properly cleaned and dried.
- 

## RETRIEVAL CONVERSION

---

- 1 Remove the spool from the frame by squeezing the hub release lever and lifting the spool free.
  - 2 Remove the pentagon shaped wire retainer with your finger nail or a small screwdriver.
  - 3 Turn the spool over and tap out the one-way bearing.
  - 4 Replace the one way bearing in the frame with the metal housing facing up for right hand retrieve.
  - 5 Snap the wire retainer back in the groove, and confirm it is properly seated.
  - 6 Place the spool back in the frame.
  - 7 Assure correct retrieve direction and smooth operation.
